Wisej Examples

Polymer WebComponents

1 OVERVIEW

Demonstrates how to create Wisej WebComponent classes, handle events from the Polymer widgets, add specific properties, and import non-visual polymers.

Note that the polymers are now hosted at https://wisej.s3.amazonaws.com/libs/polymers/.

You can change the base URL by assigning the static property *Wisej.Web.Ext.PolymerComponent.PolymerBaseUrl*. to the location of your polymers libraries.

2 WHAT TO LOOK FOR

- Extend Wisej.Web.Ext.PolymerWidget, add specialized properties, events and methods.
- Import Polymer Icon libraries using the PolymerComponent.
- Create composite polymer widgets using HTML content (i.e. radio button groups).

3 HOW TO CREATE YOUR OWN

Create the Polymer WebComponents that you want to use by deriving from Wisej.Web.Ext.PolymerWidget.

You may also use Wisej.Web.Ext.PolymerWidget directly and experiment with the Properties and Events until you know which events, properties and methods you want to declare in your specialized classes.
