Wisej Examples

User Desktop

1 OVERVIEW

This example shows how to use the Wisej.Web.Desktop component to create a custom desktop. It has been extended with the BingWallpaper extension to show some very nice backgrounds.

2 WHAT TO LOOK FOR

- How to assign the main desktop to the application. Note that an application can have multiple desktops but only one can be active.
- Create movable controls on any surface (drag the button on the desktop).
- Desktop thumbnails created on the fly from the windows on the desktop.

3 HOW TO CREATE YOUR OWN

With a Wisej project open, right click on the project or a folder, select Add->New Item, then select Installed\Visual C#\Wisej\Desktop or create a new project:

File->New->Project select Installed\Templates\Visual C#\Wisej\Web Desktop Application.
